Understanding how carefully managed moisture levels can play a significant role in the reduction of some common turf diseases, Headland Amenity will be shining a spotlight on their range of water management products - including TeraFirm, DewCure and TriCure AD - at BTME 2022. The Headland technical team will be on hand to discuss this, alongside their full range of plant nutrition products for golf and sports turf on the Origin Amenity Solutions stand – Purple 424.

Maintaining optimum water-soil balance in both wet and dry periods of the season is a key principle in the overall approach to retaining plant health. **Terafirm** is a soil penetrant formulated to improve the downward movement of water through the soil, helping to achieve a faster-draining, firmer and healthier surface. Its unique non-phytoxic formulation reduces the surface tension of water, minimising lateral water movement and maximising drainage. **Terafirm** also acts to quicken surface drying and open up pore space within the soil during dry down by accelerating natural soil contraction.

Through the formation of a water-resistant, rainfast coating on the plants surface, Headland's **DewCure™** has also demonstrated considerable success in reducing leaf surface moisture. With the activity of damaging foliar diseases like *Microdochium nivale* and Dollar Spot positively linked with conditions conducive to high leaf moisture, utilising **DewCure™** to control dew and guttation fluid can help to suppress disease activity.

Looking further ahead, **TriCure AD** is known as a highly effective wetting agent used to combat hydrophobic conditions on fine turf. With application rates adjustable to conditions, expectations and soil types, **TriCure AD** contains three separate soil surfactant technologies to counteract hydrophobicity on sand, soil and organic matter. As well as being effective in the recovery of drought damaged areas, **TriCure AD** is also a valuable tank-mix partner for a number of other Headland products.
